Trefil, the Industrial Archaeology and History

Case Study: Industrial Archaeology. 'Industrial Archaeology' is a term which has developed a number of connotations since it was coined in the late 1950s. Its earliest concise definition was 'the archaeology of the first Industrial Revolution'. The term has since been extended to apply to an enthusiast-driven movement often focussed on recording and preserving machinery, mills and other hardware.

Impact of COVID-19 on the UK industrial heritage sector. The wider industrial heritage and industrial archaeology sector has been severely hit by the COVID-19 health crisis. Between the 23rd March and the end of June 2020 all the 600+ listed and scheduled industrial sites preserved as heritage attractions in England have been closed, as have the hundreds of protected industrial heritage sites in Scotland, Northern Ireland, and Wales normally open to the public.

Impact of COVID-19 on the UK industrial heritage sector ...

The Barbegal watermills in southern France are a unique complex dating back to the 2nd century AD. The construction with 16 waterwheels is, as far as is known, the first attempt in Europe to build a machine complex on an industrial scale. - HeritageDaily - Archaeology News

Industrial archaeology is the study of early industrial buildings and machinery, particularly of the eighteenth and nineteenth centuries. When this book was originally published in 1963, this was becoming a topic of lively interest and controversy among archaeologists, historians, architects and engineers. This book discusses the aims and methods of the science, giving examples of the contribution which different kinds of specialists can make. This shows a fascinating slice of the history of the discipline of archaeology as well as offering insights into industrial archaeology when the term was first being used. As the first text on the subject, this book also led to the start of the industrial archaeology movement in the USA.

Industrial Archaeology uses the techniques of mainstream archaeological excavation, analysis and interpretation to present an enlightening picture of industrial society. Technology and heritage have, until recently, been the focal points of study in industrialization. Industrial Archaeology sets out a coherent methodology for the discipline which expands on and extends beyond the purely functional analysis of industrial landscapes, structures and artefacts to a broader consideration of their cultural meaning and value. The authors examine, for example, the social context of industrialization, including the effect of new means of production on working patterns, diet and health.

Eleanor Conlin Casella and James Symonds The essays in this book are adapted from papers presented at the 24 Annual Conference of the Theoretical Archaeology Group, held at the University of Manchester, in December 2002. The conference session "An Industrial Revolution? Future Directions for Industrial Archaeology," was jointly devised by the editors, and sponsored by English Heritage, with the intention of gathering together leading industrial and historical archaeologists from around the world. Speakers were asked to consider aspects of contemporary theory and practice, as well as possible future directions for the study of industrialisation and - dustrial

societies. It perhaps fitting that this meeting was convened in Manchester, which has a rich industrial heritage, and has recently been proclaimed as the "archetype" city of the industrial revolution (McNeil and George, 2002). However, just as Manchester is being transformed by regeneration, shaking off many of the negative connotations associated with factory-based industrial production, and remaking itself as a 21 century city, then so too, is the archaeological study of industrialisation being transformed. In the most recent overview of industrial archaeology in the UK, Sir Neil Cossons cautioned that industrial archaeology risked becoming a "one generation subject", that stood on the edge of oblivion, alongside the mid-20 century pursuit of folklife studies (Cossons 2000:13). It is to be hoped that the papers in this volume demonstrate that this will not be the case.

An illustrated study of industrialization and its physical remains in Britain. The book describes how the process affected the nation's whole culture, and contains extensive references to surviving sites and structures, which are illustrated and pinpointed in maps and a gazetteer.

The Council for British Archaeology was the first organisation to champion the cause of 'Industrial Archaeology', over 50 years ago. Since the term 'Industrial Archaeology' was first used by the CBA in the late 1950s, the landscape of our industrial towns and cities has changed beyond recognition. Our industrial heritage is all around us, but many of the structures are severely threatened by modern development. This has recently been recognised by English Heritage with the publication of their Industrial Heritage at Risk list. Britain has long been recognised as the cradle of the industrial revolution, and buildings and monuments from industries as diverse as brewing to china clay extraction can be found around the UK. This book considers not only the industries themselves but also the power that drove them, the transport network that distributed the products, and the houses in which the workforce lived. -- Publisher.

The Royal Commission on the Ancient and Historical Monuments of Wales has a leading national role in developing and promoting understanding of the archaeological, built and maritime heritage of Wales, as the originator, curator and supplier of authoritative information for individual, corporate and governmental decision makers, researchers, and the general public.

Michael Stammers tells the history of the British harbour and looks at the industrial archaeology of both harbours and ports. For over 2,000 years, we have built man-made harbours and, as an island nation, they have played a great part in our history. From the smallest harbour to huge 'super ports' like Southampton and Felixstowe, every harbour or

port can give a clue to its history and development and Michael Stammers takes us through the history and shows us what remains today to give a clue as to the history of the ports.

Industrial archaeology is the study of early industrial buildings and machinery, particularly of the eighteenth and nineteenth centuries. When this book was originally published in 1963, this was becoming a topic of lively interest and controversy among archaeologists, historians, architects and engineers. This book discusses the aims and methods of the science, giving examples of the contribution which different kinds of specialists can make. This shows a fascinating slice of the history of the discipline of archaeology as well as offering insights into industrial archaeology when the term was first being used. As the first text on the subject, this book also led to the start of the industrial archaeology movement in the USA.

In this book Kenneth Hudson sets out to restore 'industrial monuments' to their place at the centre of the wider history they embody, social and economic as well as technical. Less than this, he claims, cannot properly be called industrial archaeology. The author provides fully illustrated examples from many countries.
